

An Updated on Urogynecology

Dear esteemed Colleagues,

Over the years, interest in anatomical and functional disorders affecting the genitourinary and colo-proctological apparatus has increased in relation to the advancement in scientific knowledge, diagnostic and therapeutic techniques, and a greater awareness among women to these pathologies.

Dysfunctions of the pelvic floor conclude anatomical alterations (prolapse of the bladder, uterus and rectum in various combinations), urinary distress (retention and incontinence) and bowel activity (constipation and incontinence). These disorders are often associated with health costs and decreased quality of life that can reduce self-esteem and prevent a complete individual expression in social settings.

In light of this, as Guest Editors, we aim to attract a collection of reviews with a special emphasis, where appropriate, on multidisciplinary management of urogynecological and colo-proctological dysfunctions. All review articles concerning diagnostic, therapeutic, pharmacological and/or surgical and rehabilitative approaches will be welcomed and considered by our editorial team.

We wish you all and your families to stay safe and well! We are welcome you to contribute related papers to us, to discuss the latest research and new ideas in the field.
