Values are frequency, percent ± standard error.

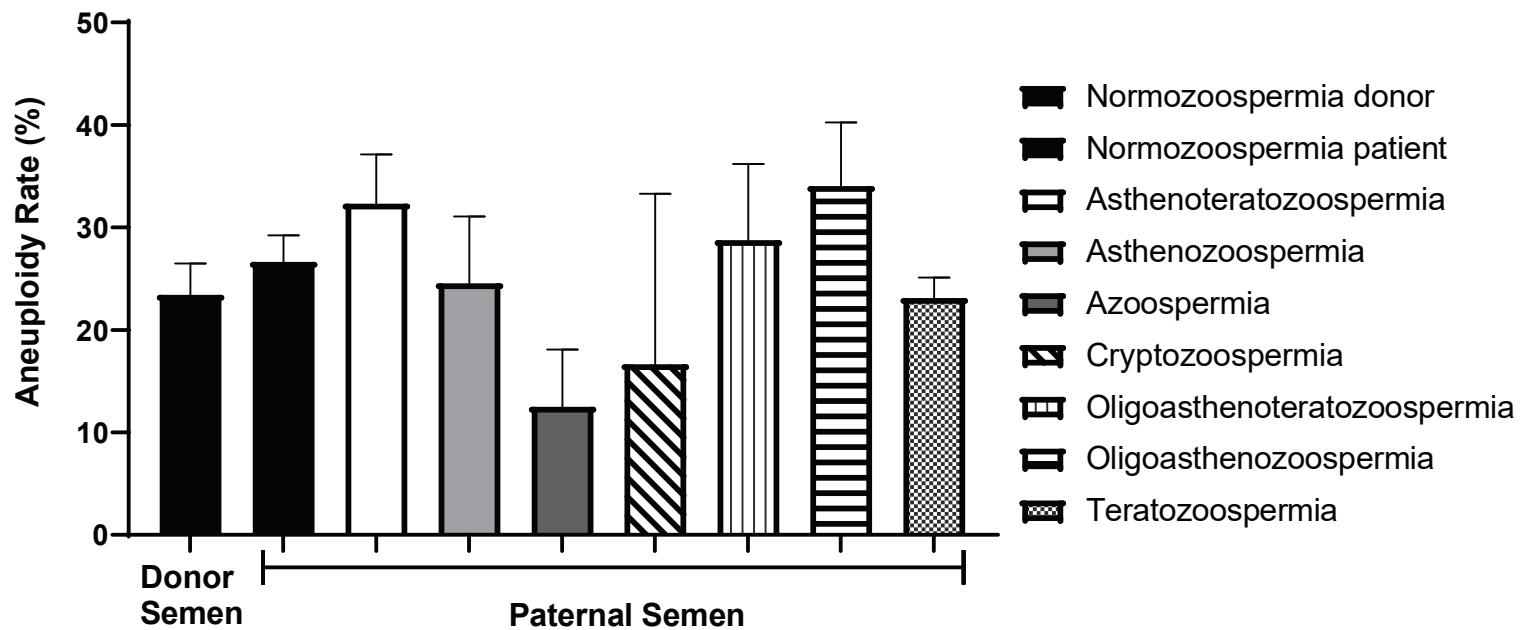

<sup>a</sup>Three embryos had completely abnormal chromosomal profiles.

<sup>b</sup>Two embryos had completely abnormal chromosomal profiles.

\* indicates a significant difference ( $p < 0.05$ , chi-2 test) in the rate of chromosome abnormalities between embryos from patient semen and donor semen.

Supplement Fig. 1. Aneuploidy rates for embryos developed from donor ova using patient or donor sperm, stratified by etiology. The column height corresponds to the average aneuploidy rate, whereas the bar length is the standard error. Differences between groups were determined with ANOVA with a post hoc Bonferroni test. Significant differences ( $p<0.05$ , two-tailed) are indicated with an asterisks.
