Supplementary Fig. 1. Gene Expression Profiling Interactive Analysis database. (A) CRTAC1 is found to be significantly decreased in UBUC (n=404) compared with that in the adjacent normal tissues. (B) Violin plots show that the mRNA levels of CRTAC1 significantly decreased as the UBUC stage increased (from stage II to stage IV). (C) UBUC patients with high CRTAC1 mRNA levels have significantly better overall survival than those with low CRTAC1 mRNA levels. (*, p<0.001)
