Supplementary Figure S1 - The *B. longum* was decreased in the gut of mice during the occurrence and development of HCC

A. Schematic representation of the timeline for the establishment of the DEN-induced HCC model.
B. The gross morphology of the liver collected at week 24.
C. The H&E staining of the liver collected at week 24. Scale bar = 100 μm.
D. The count of *B. longum* in the fecal samples collected at weeks 18 and 24 was determined by RT-PCR.

*** means $P < 0.001$ when vs. the control group.
